

FAST FOOD ISN'T THAT BAD!

Elise Reynolds - CS 150

Fast food has been unfairly blamed for obesity - when in reality, other lifestyle factors matter more.

MYTHS

WHY DO WE ASSUME FAST FOOD IS THE MAIN CAUSE OF OBESITY?

1

**“FAST
FOOD =
FAT”**

The more
burgers you
eat, the
bigger you
get.

2

**EXERCISE
IS
OPTIONAL**

You can
out-diet a
sedentary
lifestyle.

3

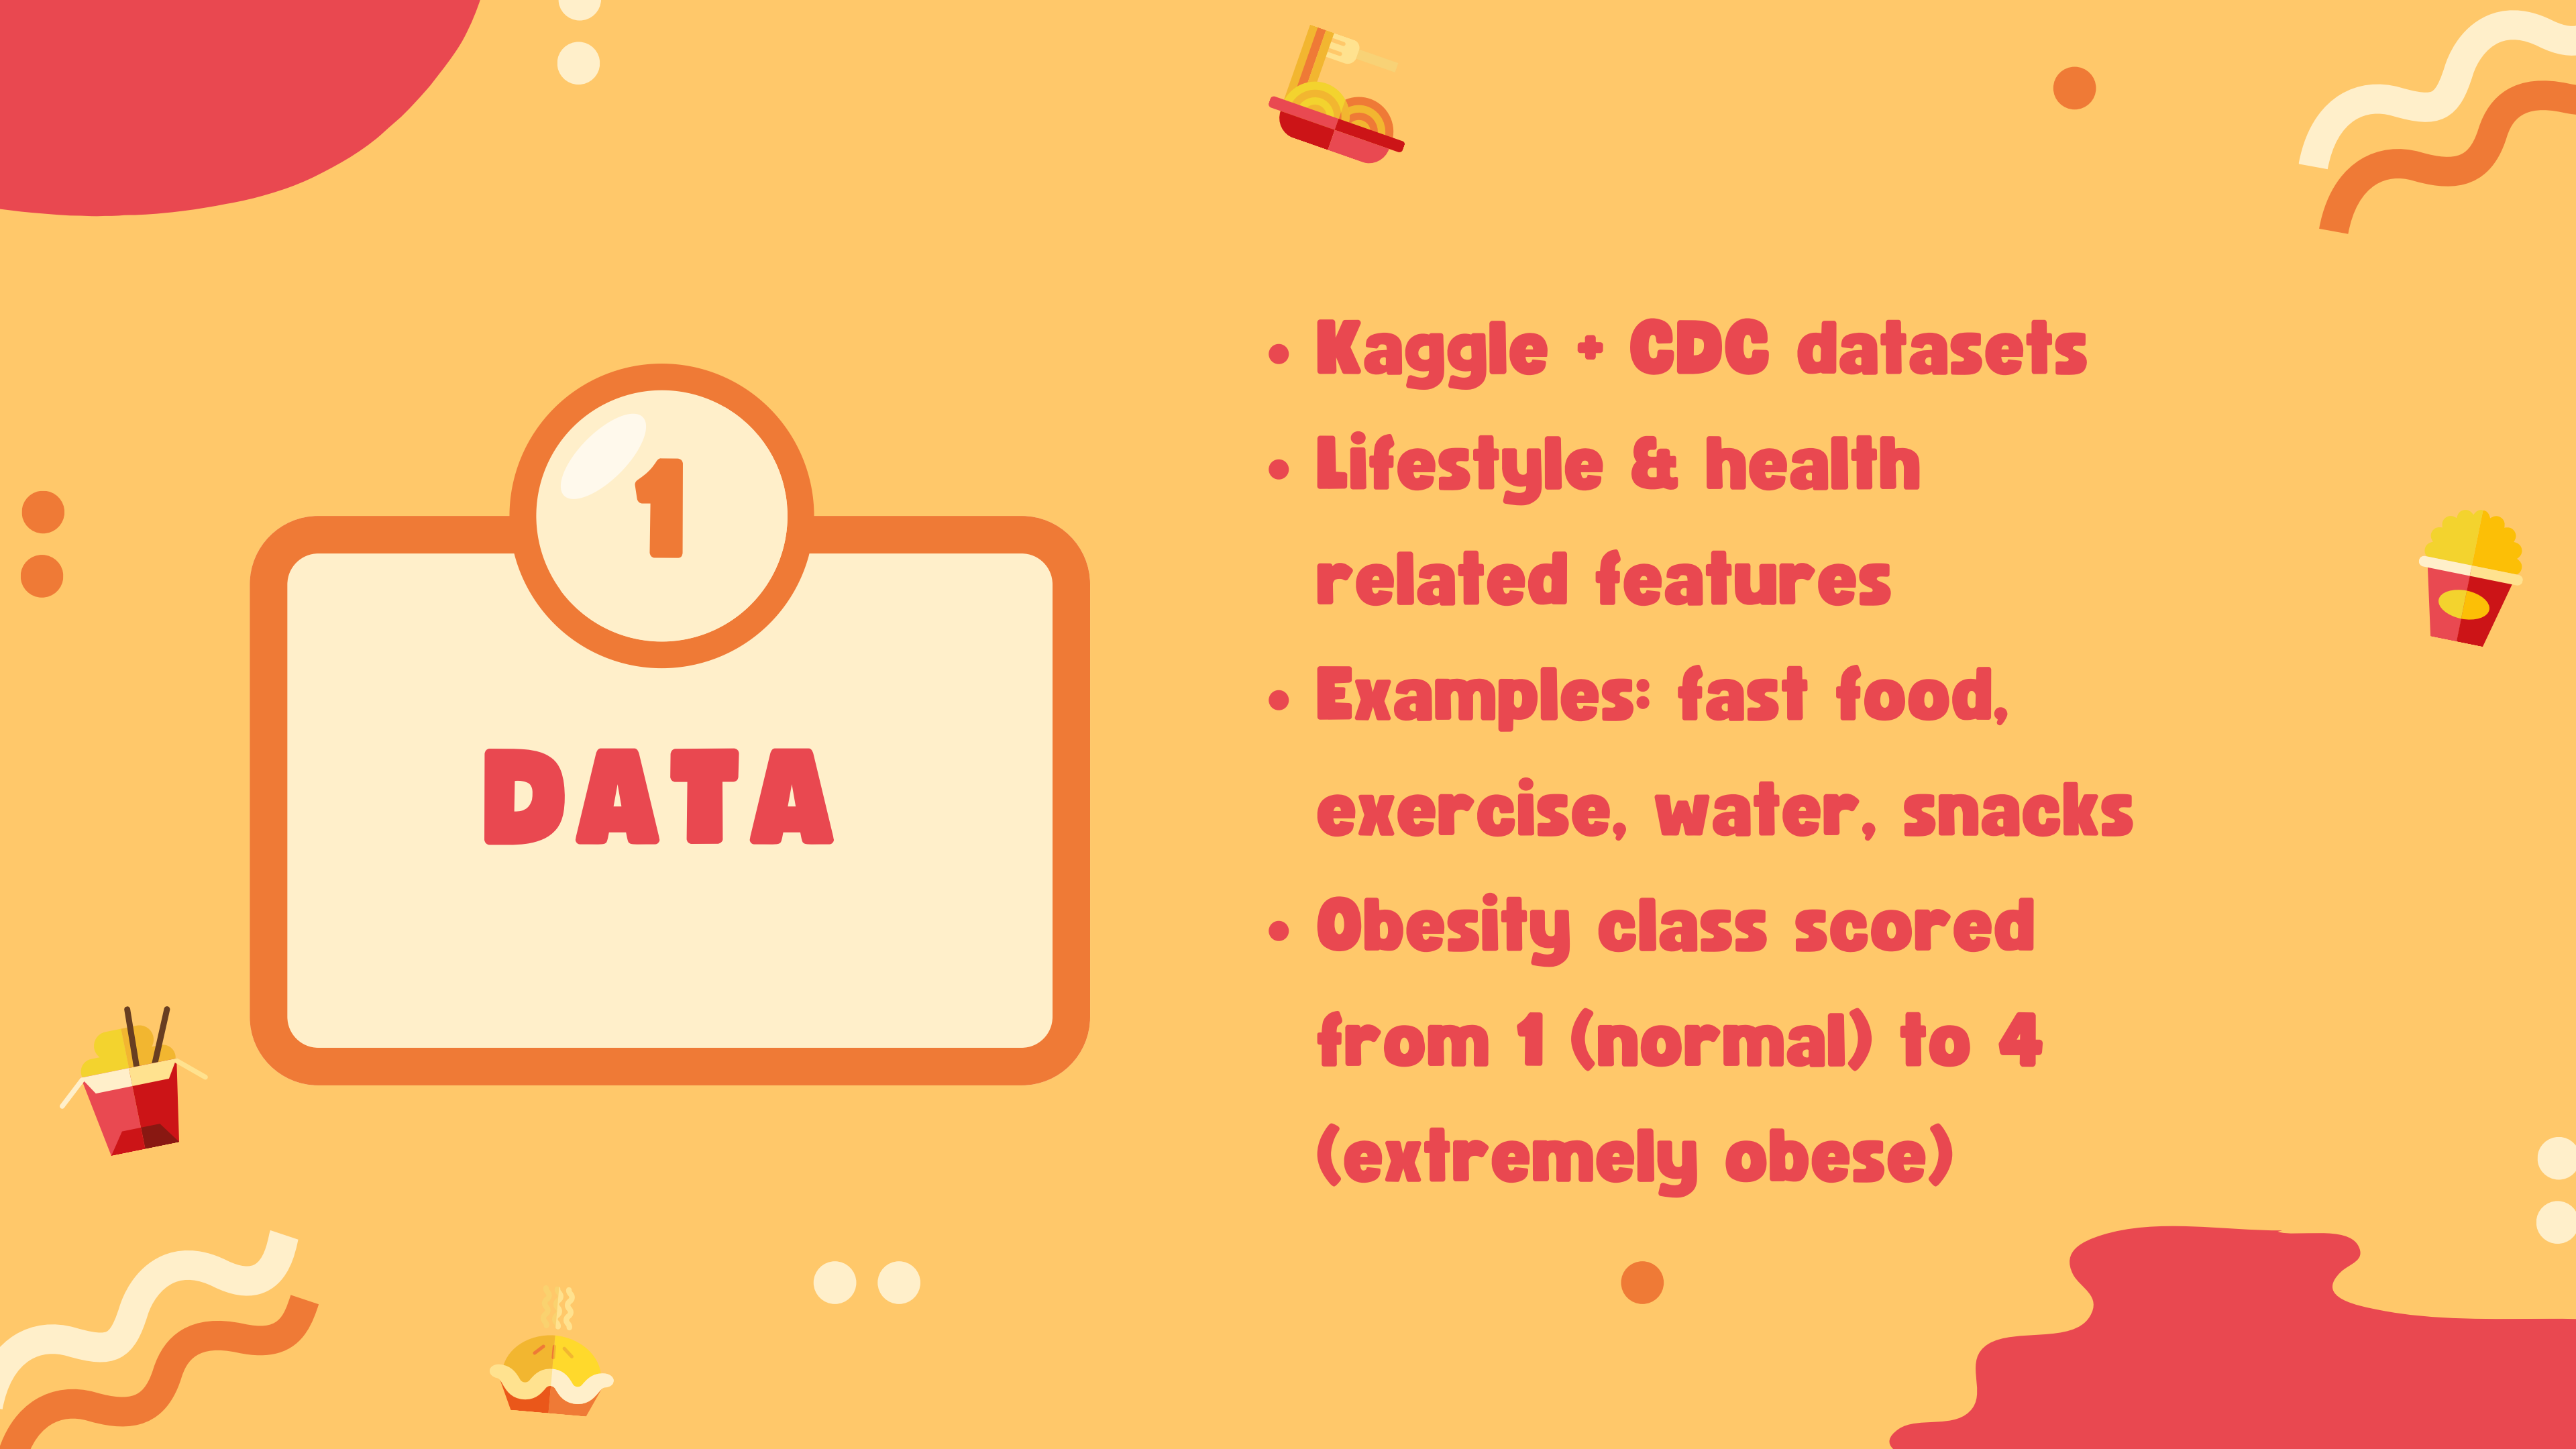

**CALORIES TELL
THE WHOLE
STORY**

Lower
calories =
lower
weight,
always.

4

**BLAME THE
DRIVE-
THRU**

If obesity's
rising, it must
be McDonald's
fault.

1 DATA

- **Kaggle + CDC datasets**
- **Lifestyle & health related features**
- **Examples: fast food, exercise, water, snacks**
- **Obesity class scored from 1 (normal) to 4 (extremely obese)**

FINDINGS

**Fastfood alone
didn't strongly
correlate with
higher obesity**

Eating fast food often
didn't mean someone was
in the highest obesity class

**Lifestyle factors like
snacking, exercise, hydration
were more telling**

Snacking, hydration, and
exercise patterns were
more predictive than food
type.

**THE
TRUTH**

The background is a solid light orange color. It features several decorative elements: a large pink semi-circle in the top-left corner; a small icon of a fork and knife with a plate of food in the top-center; a wavy white and orange line in the top-right; two small orange circles on the left side; a small icon of a red and yellow fast-food container with a yellow lid on the right side; a small icon of a red and yellow fast-food container with a yellow lid in the bottom-left; a small icon of a yellow and orange fast-food container with a yellow lid in the bottom-center; and a large pink abstract shape in the bottom-right corner.

✓ **Truth: CDC & health experts confirm fast food is linked to poor outcomes when consumed excessively.**

✓ **Real conclusion: Fast food plays a role, but it's not the only factor.**
